HEFT numerator factors

In this worksheet we present the code for computing the gauge invariant form for the HEFT numerator factor.
The code implements the algorithm described in the paper
HEFT Numerators from Kinematic Algebra
by Chih-Hao Fu, Pierre Vanhove and Yihong Wang
arXiv:

The main routines are in the file : **functionsHEFT.wl** which needs to be executed before running this worksheet

We run some example of gauge invariant numerator factors for the emission of n gluons of momenta k_i and field-strengths F_i from a massive scalar line of momentum p

With the convention that k1+k2+...+kn=p'-p with ki^2=0, p^2=(p')^2=0 and p.(k1+...+kn)=0

We present the tree structure described in section 4.2 of the paper, and the expression for the gauge invariant numerator factors
